jwks — -zsh — 111×55

NAME	POINTS	AWARDED	NOTES
/auth valid JWT authN	15.00	15.00	
Valid JWK found in JWKS	20.00	20.00	
Database exists	15.00	15.00	
Database query uses parameters	15.00	15.00	
Quality	20.00	17.00	The code is generally well-organized with clear separation of concerns, but could benefit from more modularization, especially in the database handling. Best practices are mostly followed, including parameterized queries to prevent SQL injection, but error handling could be improved, particularly in database operations. Readability is good, but additional docstrings for functions and classes would enhance understanding. Overall, the code quality is solid, but consider implementing logging for better traceability and debugging. Database query security is adequately addressed through parameterization, but ensure to handle potential exceptions during database operations to avoid silent failures.
